

Benefits of External Drive

Now that most computers come with larger internal hard drives, many people may feel that they don't need an external hard drive. But there are several good reasons to add an external hard drive to your computer configuration. Many companies produce excellent hard drives and selecting the one that's right for your needs may not be an easy task.

Portability
Many of the hard drives made today are small and lightweight and easily moved from one location to another. This can be useful if you want to take your data (for example, your iTunes library) with you when you go on a long trip, perhaps to visit friends or relatives. Just plug your hard drive into another PC, boot up the computer using your hard drive as the boot drive and you'll feel like you're back home. If you want portability, look for one of the smaller but fast external hard drives made today.

Longer Life
If you use an external drive your life won't fall apart when your hard drive dies. Remember, when the drive in your computer dies, you can't use the computer, but if your external drive dies, you'll still be able to use your computer. Furthermore, getting your external drive repaired might take less time and cost less than repairing the internal drive on your computer. Also, using an external drive as your main drive can save wear and tear on your internal drive, and, thus, help it last longer.

As you can see, there are good reasons to use an external hard drive. Just decide on how much storage space you need, how much portability you want from an external drive and how much you want to spend, and you'll be able to find the drive that's best for you.
